Vision in jumping spiders

(Wayne Maddison)

(Bair & Olshausen, 1991)

One-day old jumping spider
(filmed in the Bower lab, Caltech)

Orientation by Jumping Spiders During the Pursuit of Prey

(D.E. Hill, 1979)

E

Navigation

(Tarsitano & Jackson 1997)

Figure 1 a-c.

Head-direction cells in ellipsoid body of *Drosophila* (Seelig & Jayaraman 2015)

Ellipsoid body activity
(calcium imaging)

Decoded vs. actual head dir.

How to build a model of world from sensory data?

Bayesian inference

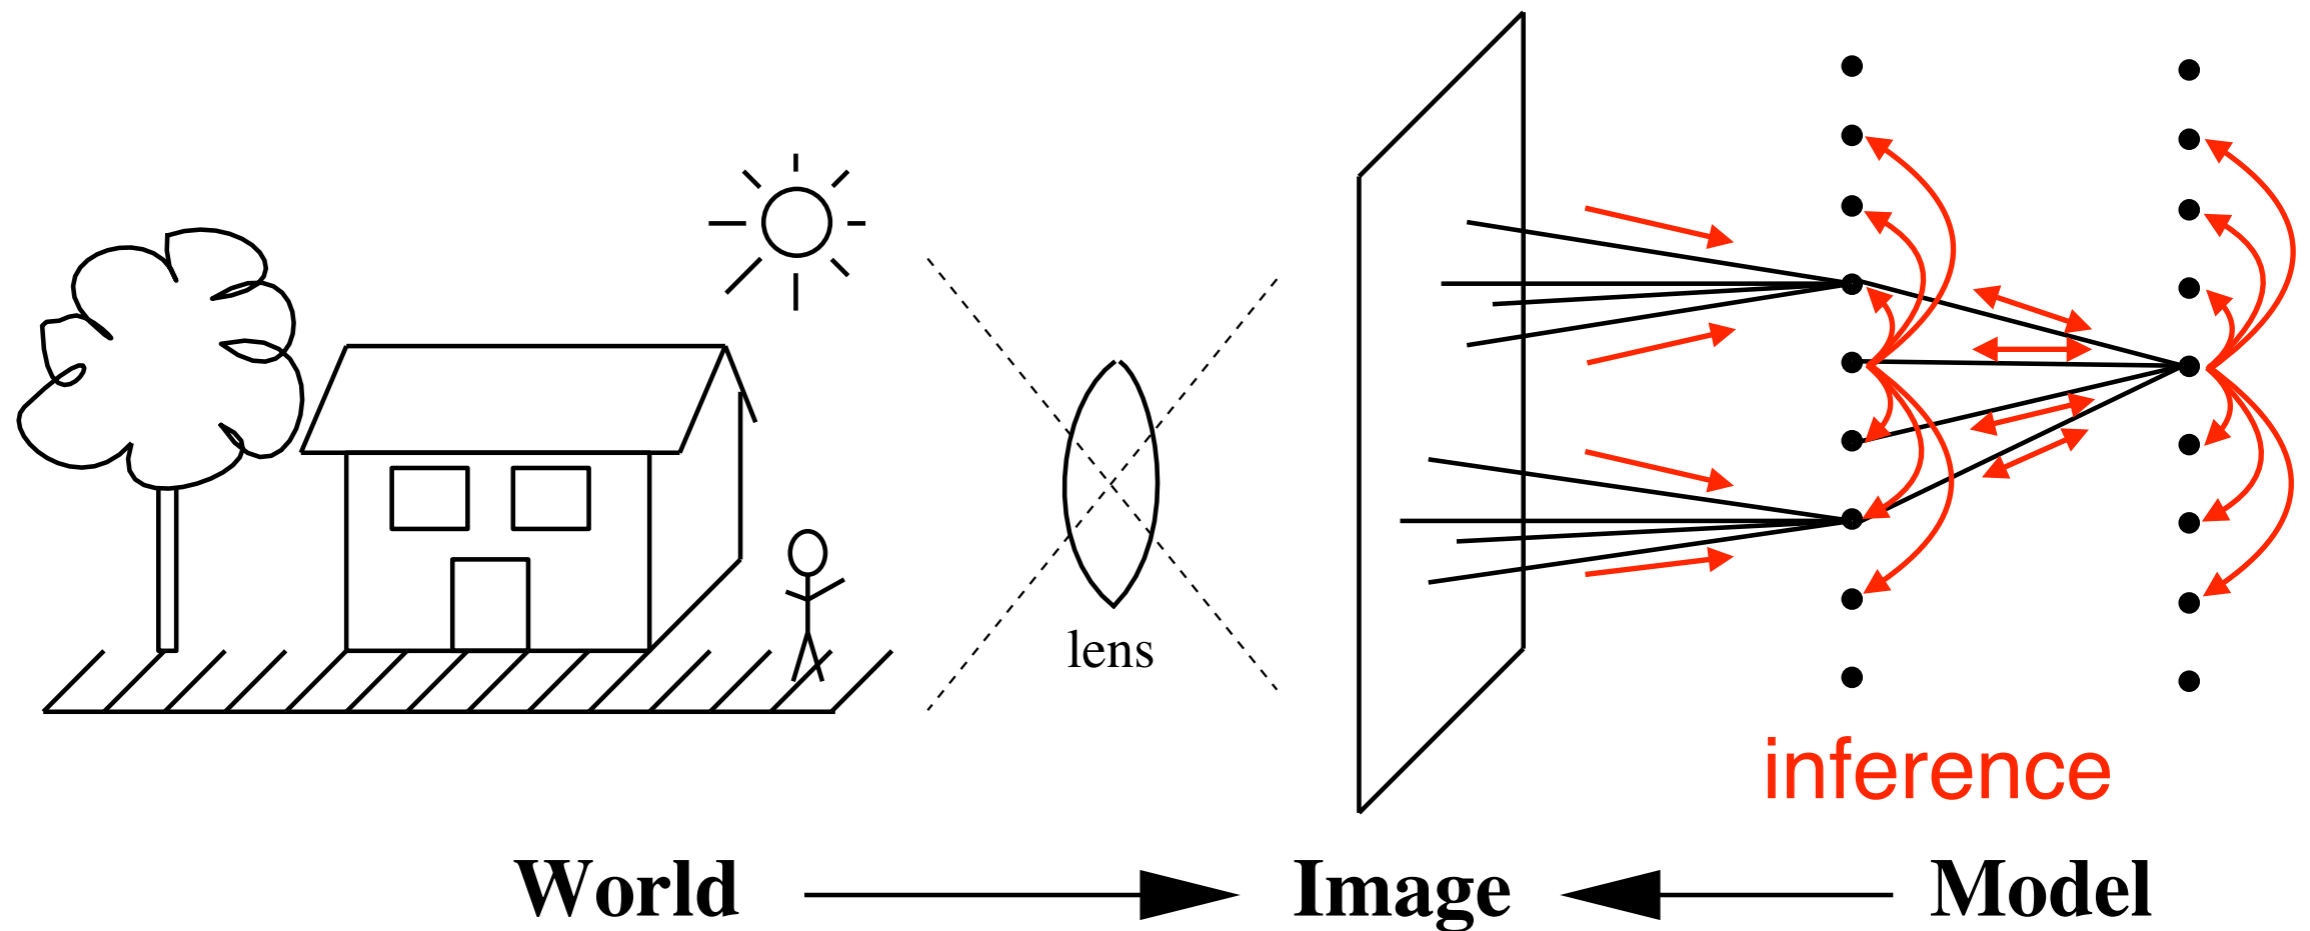

image generation prior knowledge

$$P(H|D) = \frac{P(D|H) P(H)}{P(D)}$$

?

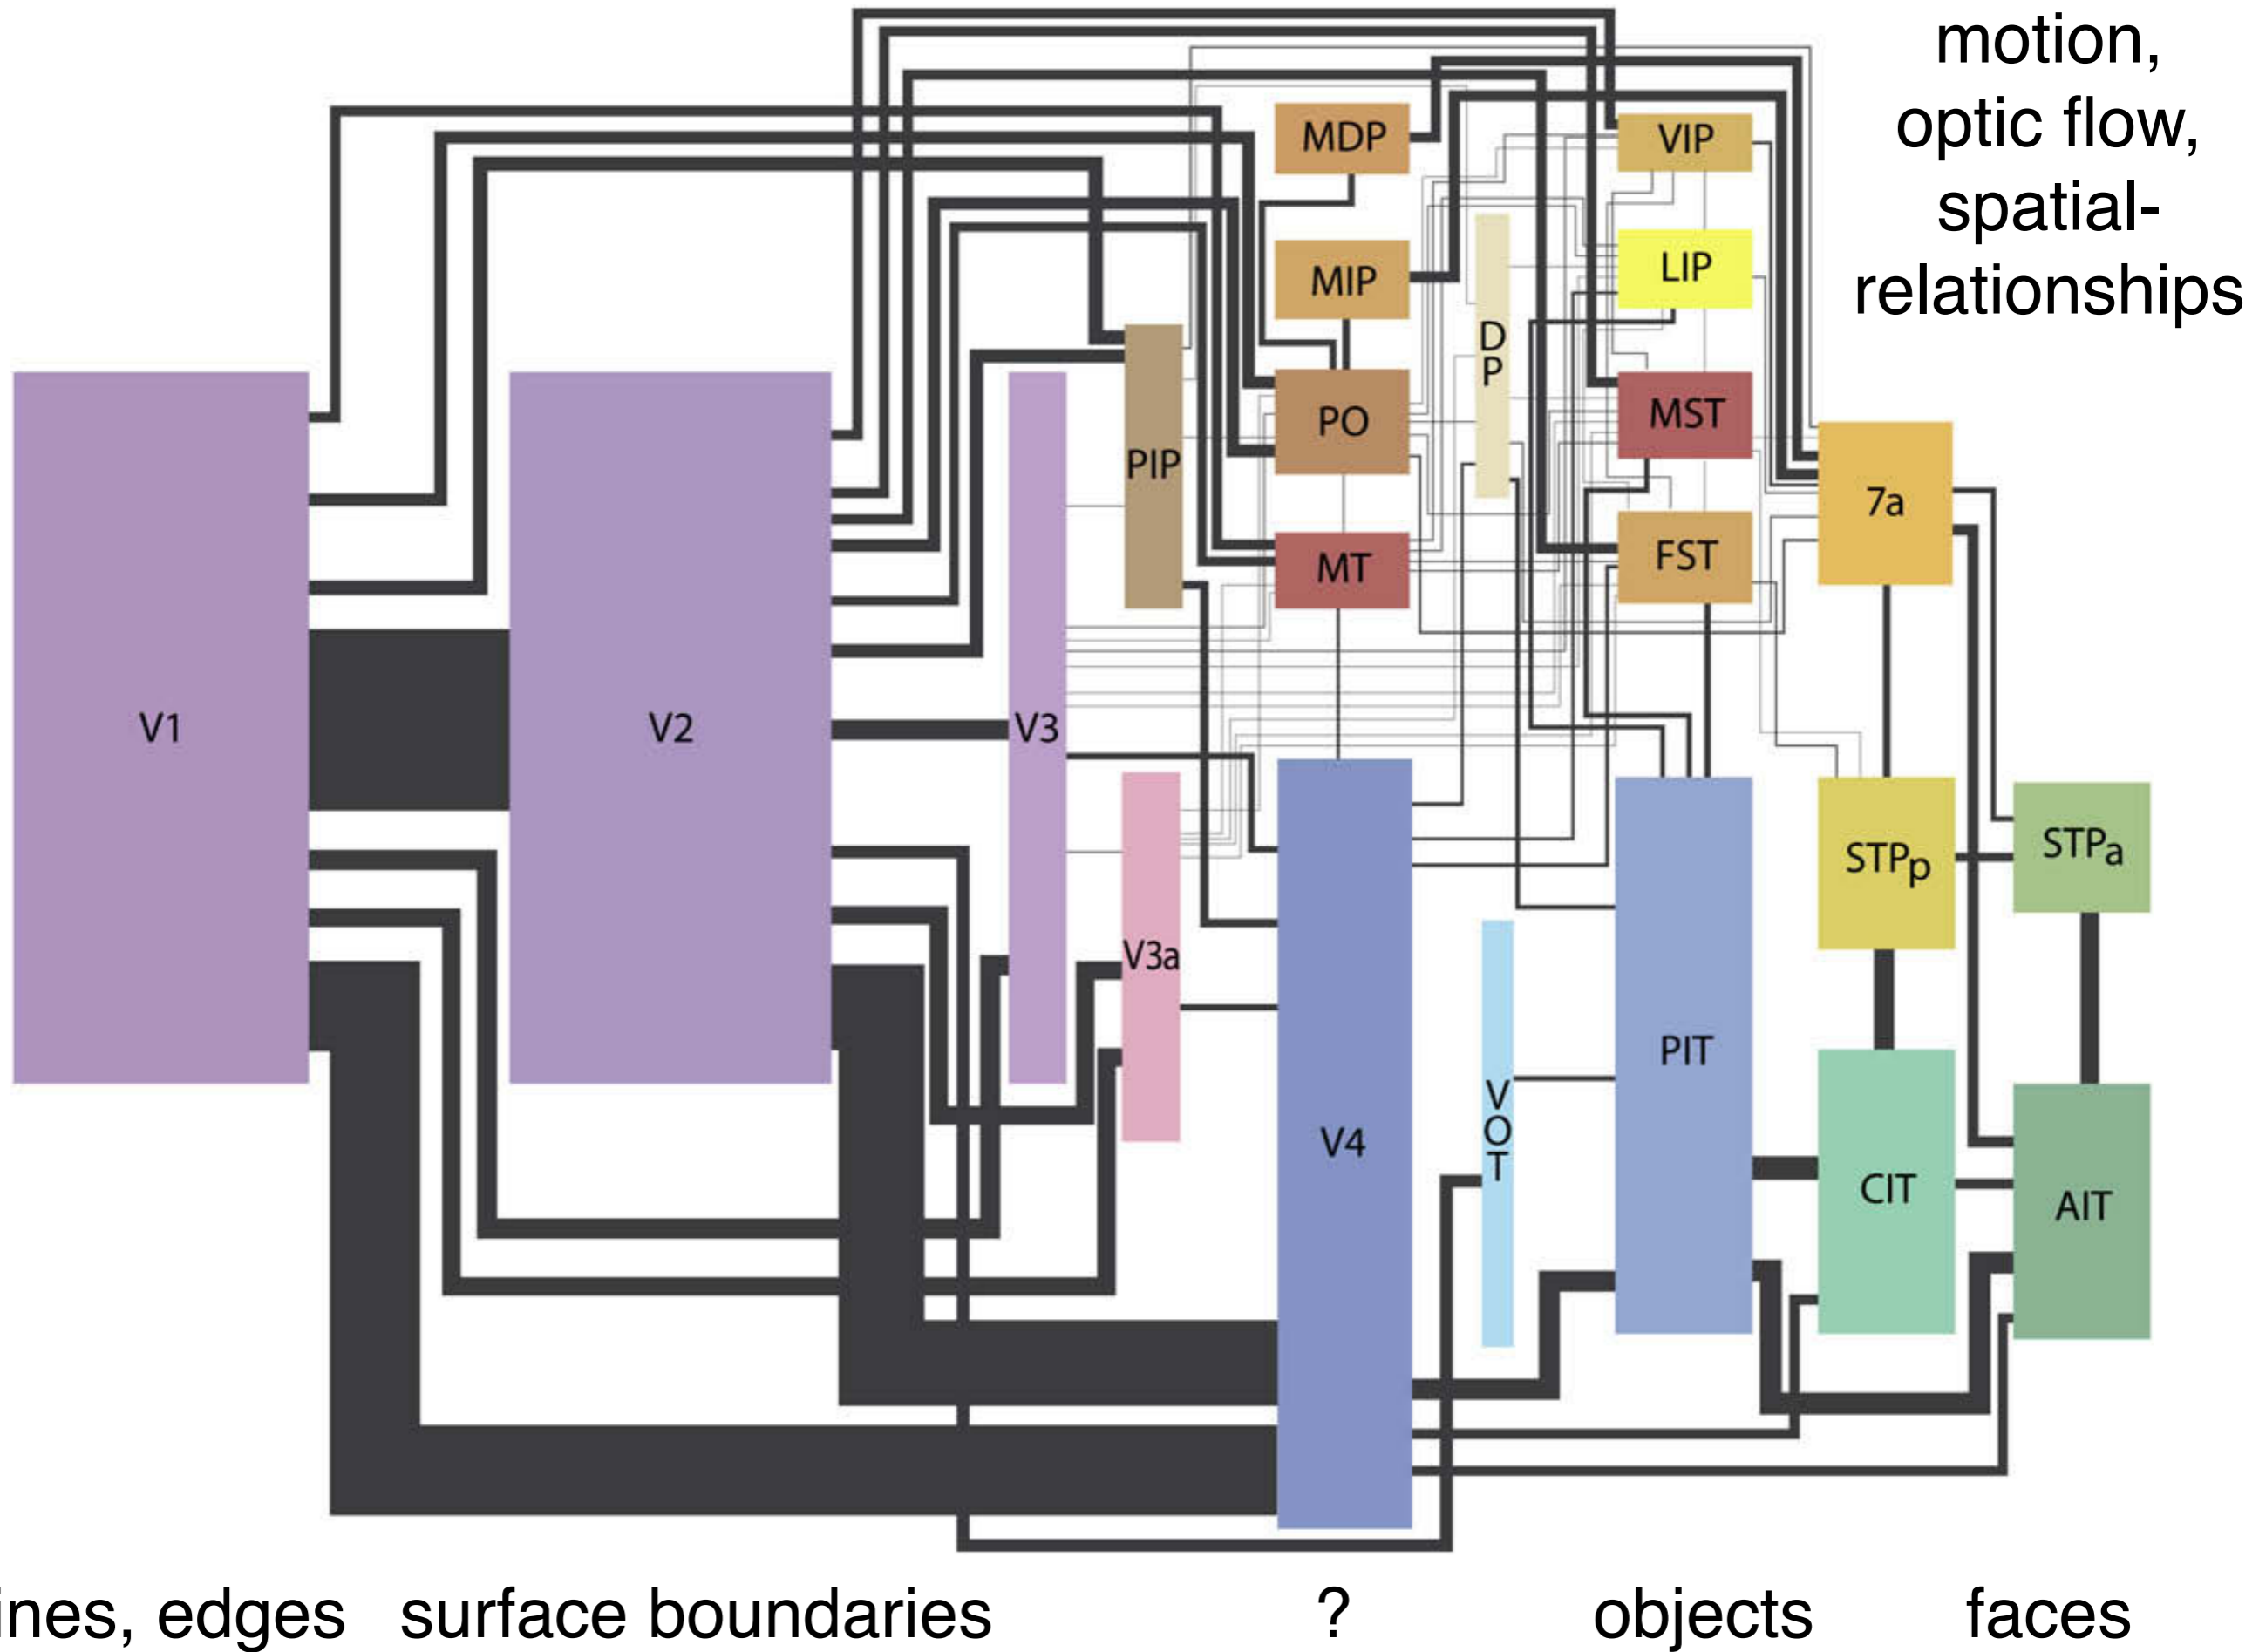

Perception as inference

$$P(I|H) \times P(H) \propto P(H|I)$$

Area V1

Lateralization of the visual pathways

V1 is highly overcomplete

LGN
afferents

IVb

IVc

layer 4
cortex

0.1 mm

Barlow (1981)

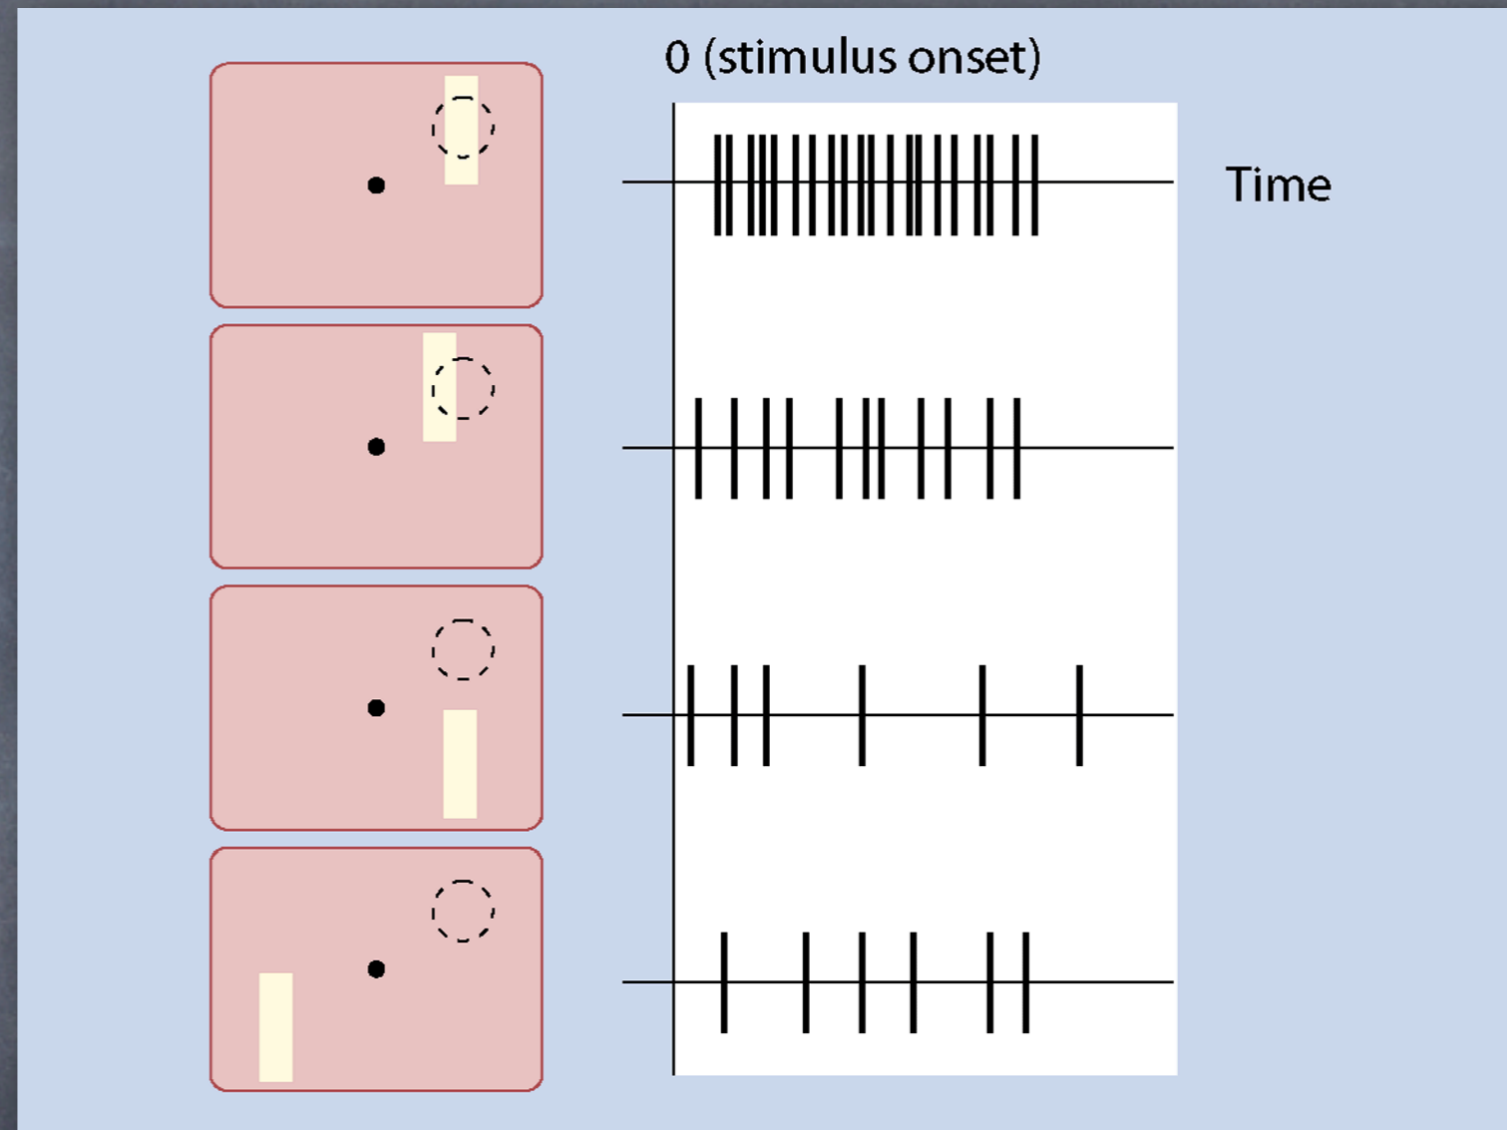

1 mm² of cortex contains 100,000 neurons and receives input from ~14x14 'pixels' in retina

Single-unit electrophysiology

Extracellular microelectrode recordings can be used to measure action potentials

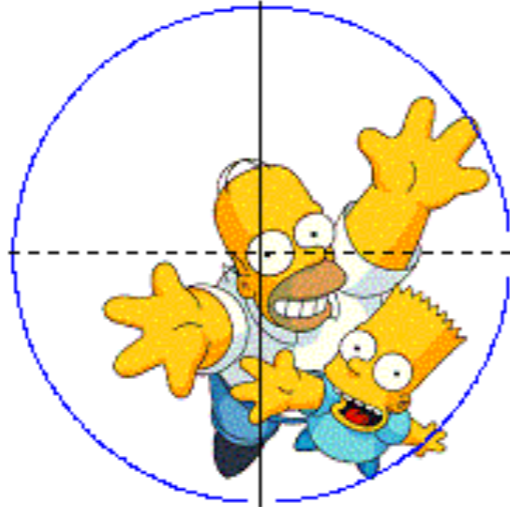

Mapping of simple cell receptive field

VI - topographic representation

Cortical magnification

Foveal oversampling in LGN and Cortex

(Connolly & Van Essen, 1984)

LGN

VI

“...despite the fact that the estimated total number of LGN cells is similar to the total number of retinal ganglion cells, their ratio must vary from many LGN cells per retinal ganglion cell for the fovea to fewer than one LGN cell per retinal ganglion cell in the periphery.”

Cortex:LGN cell ratio ranges from 1000:1 in fovea
to 100:1 in periphery
(Connolly & Van Essen, 1984)

Cortical layers

Primary visual cortex slice (Nissl stain)

Connections of cortical layers in V1

Ocular dominance columns (Horton)

1 mm² of cortex analyzes ca. 14 x 14 array of retinal sample nodes and contains 100,000 neurons
